Social sentiment → n+1 price, HKEX & KRX

Generated 2026-11-10 07:11 UTC · window 40 days · mode fixture · sources: LIHKG + AAStocks (HKEX) · Naver 종목토론실 + Blind (KRX) · news via Exa

OUT-OF-SAMPLE ROWS	DIRECTIONAL ACCURACY	BALANCED ACCURACY	AUC	MAJORITY BASELINE	MAE MODEL / NAIVE
310	0.629	0.619	0.658	0.545	0.0229 / 0.0209

Fixture mode. Social posts and news in this run come from the bundled fixtures, not from Apify/Exa. The fixtures contain a weak, deliberately injected signal so the validation harness has something to find; recover it and the pipeline works, but these numbers say nothing about real market edge. Re-run with `--live` and your own tokens for the real measurement. Price bars are real Yahoo Finance data either way.

HKEX — RANKED BY SOCIAL MENTIONS · WALK-FORWARD ACCURACY 0.619 · AUC 0.663 · N=160

HOW TO READ THIS

Sentiment is the engagement-weighted mean polarity of the day's posts (−1 … +1). **P(up)** is the walk-forward model's probability that the next close is higher; **E[r]** is its predicted next-day return. Position is LONG above 0.55, SHORT below 0.45, FLAT otherwise — a deliberately wide band, because a 52% edge is not a trade. Support/resistance are trailing 20-day lows/highs, never recomputed after the fact. Every out-of-sample row was produced by a model that had not seen that day. P(up) is not a monotone function of sentiment: the model also weighs price state (range position, gap, volume), so a bullish day at resistance on falling volume can still score below 0.5, and the two columns disagreeing is information, not a bug.
